SkillUp

8 OCTOBER 2026

In collaboration with IBM SkillsBuild

FINAL TECHNICAL SESSION

The final lap

AI Racing League

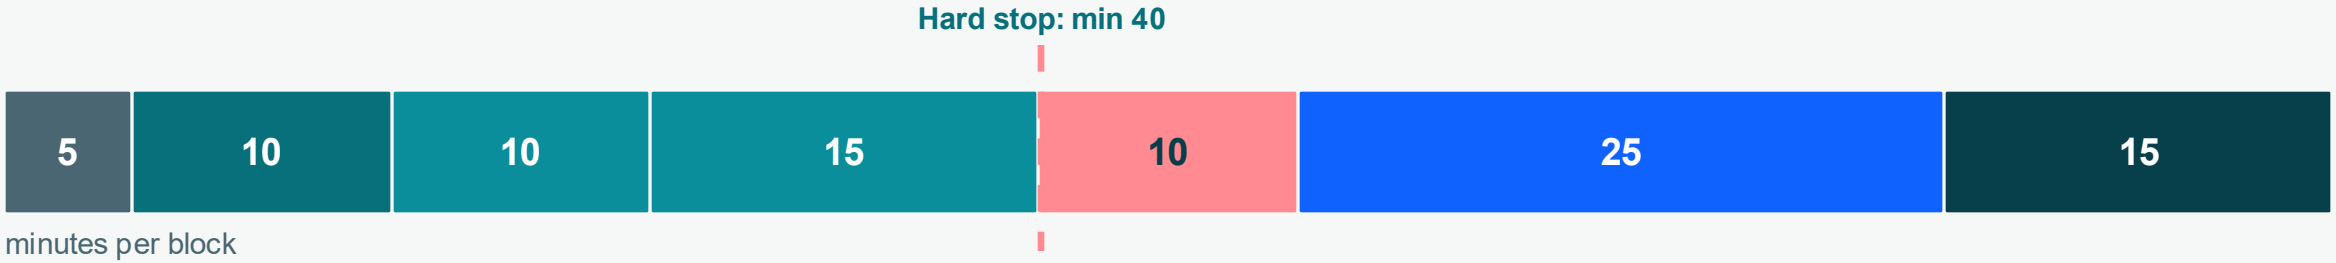

Session 4 with IBM Bob

8 October 2026

A tested driver and a submission others can open.

Our 90-minute plan

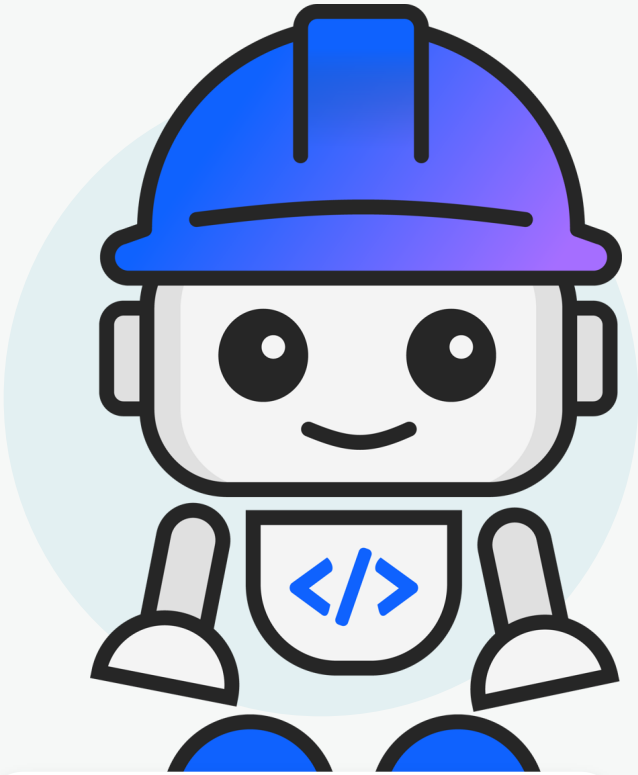

- **00–05** Existing project readiness
- **05–15** Lap evidence and next improvement
- **15–25** Coach demonstration with Bob
- **25–40** Final experiment and comparison
- **40–50** Freeze code and capture evidence
- **50–75** GitHub guided practice
- **75–90** Submission checks and showcase

Protect the GitHub time

25 minutes are reserved for GitHub. Timeboxes are for facilitation, not official rules.

Your Session 3 project: ready to continue

- Open your existing working copy
- Open its lap_data.csv and corner notes, if available
- Keep your last known working version safe
- **Chat: exact filename + best observed result + blocker**

Open your working copy

The next improvement comes from your lap

- Locate the corner or section that still costs time
- Read speed, steering and damage where recorded
- Check the current rule for that same section
- Choose one issue your evidence can support

BOB PROMPT

```
Read my existing working script, corner
notes and lap_data.csv. Identify ONE
remaining problem supported by the available
evidence. Show the relevant track range only
if the data supports it, name the actual
code lines and explain the likely cause.
Distinguish observations from hypotheses.
Propose one small final experiment and a
comparison method. Do not edit files, run
commands or invent measurements.
```

MIN 10–15

One hypothesis for the final test

Earlier braking

Test if overshooting persists

Corner cap

Test if damage begins in that section

Exit acceleration

Test if a clean exit stays slow

Base target

Test only with stable corner behaviour

Choose the one your evidence supports. Write the predicted benefit and risk before the edit.

MIN 15–25

Coach demo: one controlled change

1. **Back up the current working copy**
2. **Ask Bob for the smallest useful edit**
3. **Compare the before and after lines**
4. **Check syntax, then run the same race**

BOB PROMPT

```
Use [exact working filename]. First copy it to [unique backup filename]. Change only [specific parameter or block agreed in the diagnosis] to [agreed value]. Leave [exact baseline filename] and all other logic unchanged. Preserve existing imports, units and logging. Show the diff and explain the change. Do not install packages, publish code or run the race. If the parameter is absent, stop and ask me.
```

MIN 25–40

Your experiment: 15 minutes

15

minutes

Min 30: progress check
Min 35: finish your current run

1. Write a hypothesis before the run
2. Change one parameter or one small block
3. Run the same race and keep the output
4. Chat: change + result + keep/revert/repeat

Your final comparison

Before and after: same track and settings

BEFORE

Lap time

Damage

AFTER

Lap time

Damage

Completed lap time and change in damage

Repeat if the gain is small or inconsistent

DECISION

Keep

Revert

Test again

The final evidence package

Freeze a copy of the chosen working script

Capture a repeat run where time allows

Save a screenshot and short demonstration

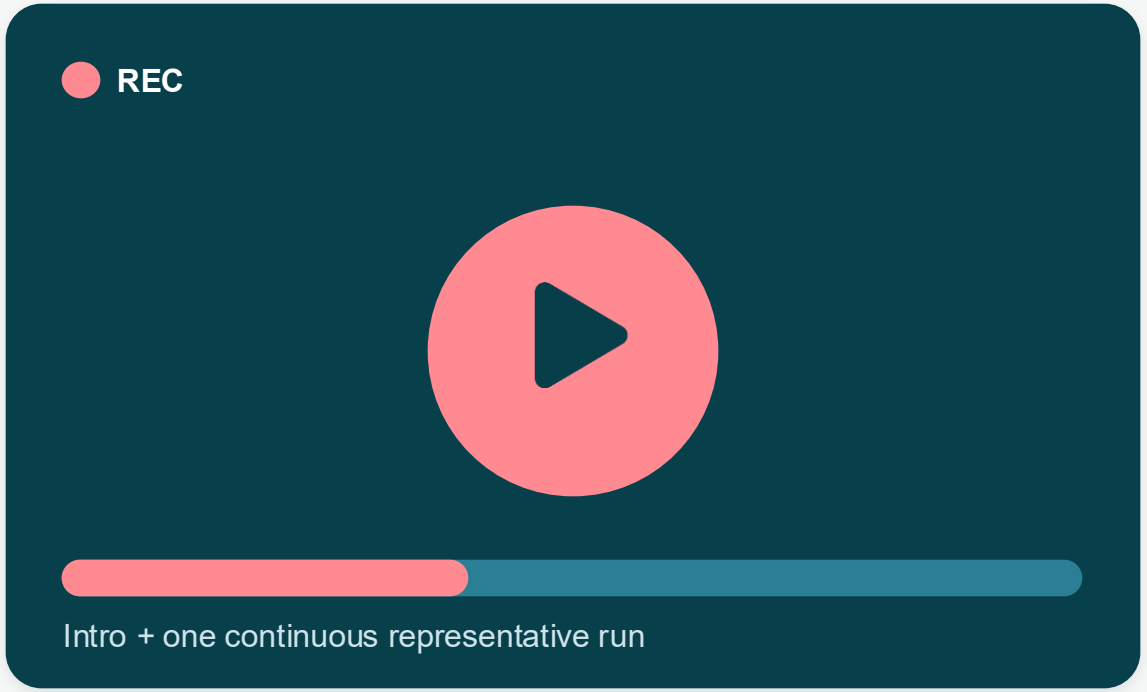

Record limitations and unfinished work honestly

Tuning stops now. Do not invent runs: record only what actually happened.

MIN 45–50

A short demonstration people can follow

- Show the script you actually ran
- Show TORCS behaviour and available time/damage
- Explain one change and how Bob helped
- Keep accounts and private windows out of frame

Do not upload large videos into the code repository. Share a link to an organiser-accepted video service.

GitHub in plain language

Repository

The project’s online folder

Commit

A saved snapshot with a message

Branch

A separate line of work

README

The project’s front page

A repository stores your files and instructions. It does not run TORCS in the browser.

The submission folder

ai-racing-submission/

- **Required to run**
  chosen script + local dependencies
- **README.md**
  setup, run command and results
- **Evidence**
  real CSV, screenshot and video link
- **SUBMISSION.md**
  description, enhancements and Bob use

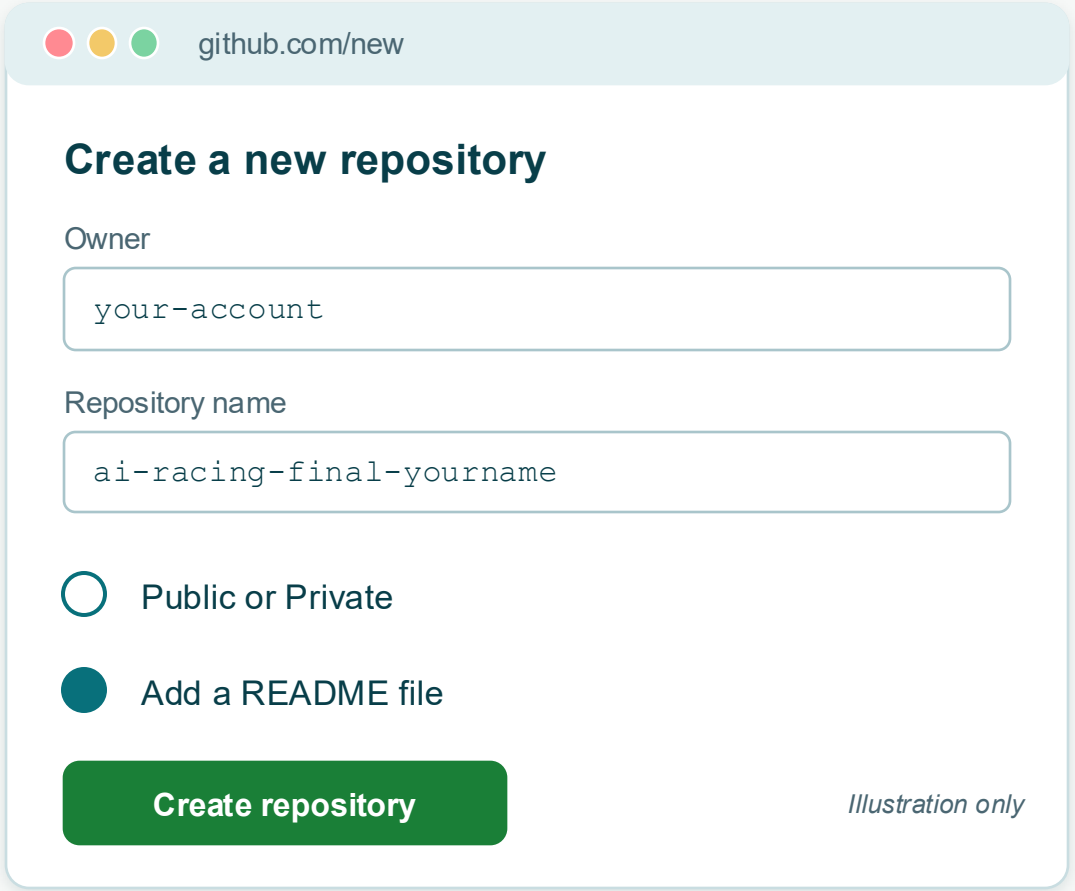

Copy selected files. Keep your originals.

BOB PROMPT

```
Prepare a separate ai-racing-submission folder.
Inspect imports in [chosen script] and list required
local dependencies. COPY approved files, never move
originals or alter the baseline. Draft README.md and
SUBMISSION.md from my actual notes and results.
Preserve exact filenames and launch options.
Describe unavailable kit components and setup
requirements. Leave unknown results blank with "not
recorded". Do not invent enhancements or publish
anything.
```

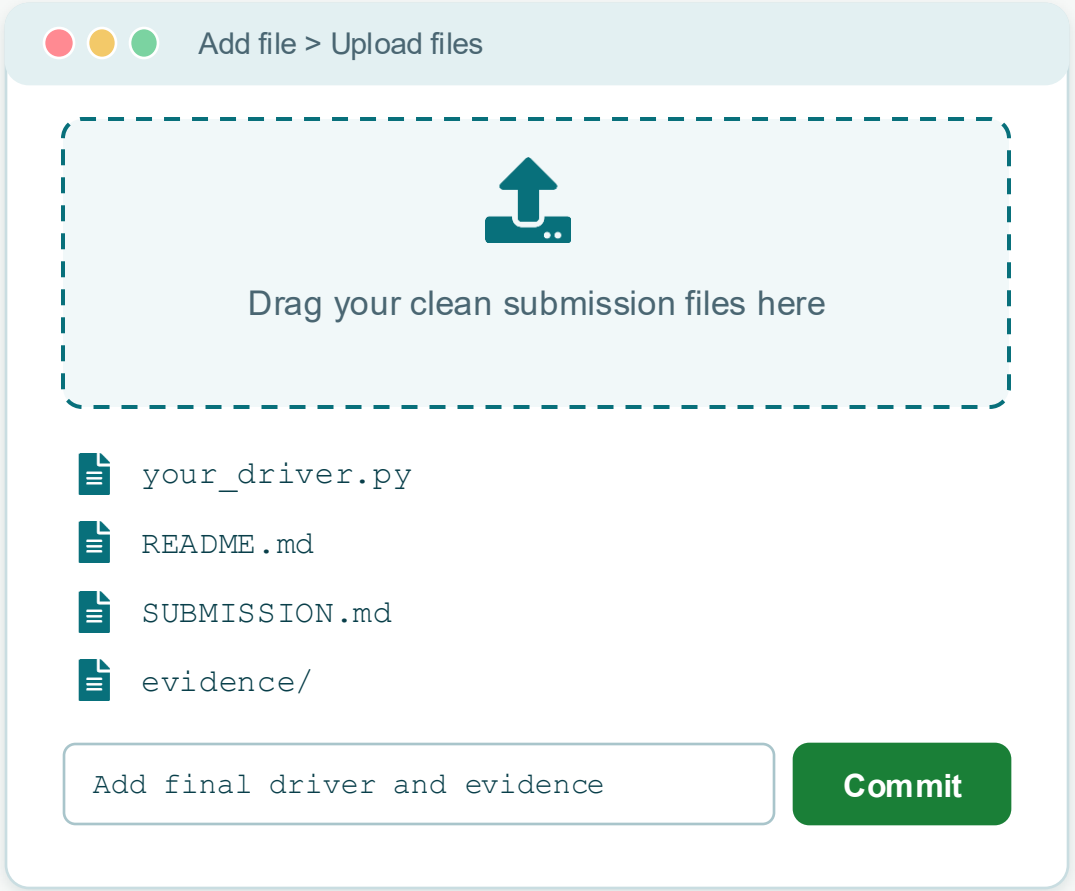

GitHub 1: a new repository

1. Sign in at github.com
2. Top-right + menu: New repository
3. Owner: your account
4. Name: ai-racing-final-yourname
5. Choose visibility and add a README
6. Create repository

GitHub 2: selected files

1. Open the repository’s Code tab
2. Add file > Upload files
3. Choose selected files or drag approved folders
4. Review every filename
5. Commit message: Add final driver and evidence
6. Save the upload or propose a branch

GitHub 3: the README

- Project and problem statement
- Exact setup and run command
- Chosen script and local dependencies
- Actual results and known limitations
- Enhancements, Bob contribution and video link

README.md · Preview

ai-racing-final-yourname

Problem

Setup and run

Results

Limitations

Enhancements, Bob, video

GitHub 4: evaluator access

Public

Test the repository link signed out

Private

Invite the authorised evaluator account

Open the driver, README and evidence

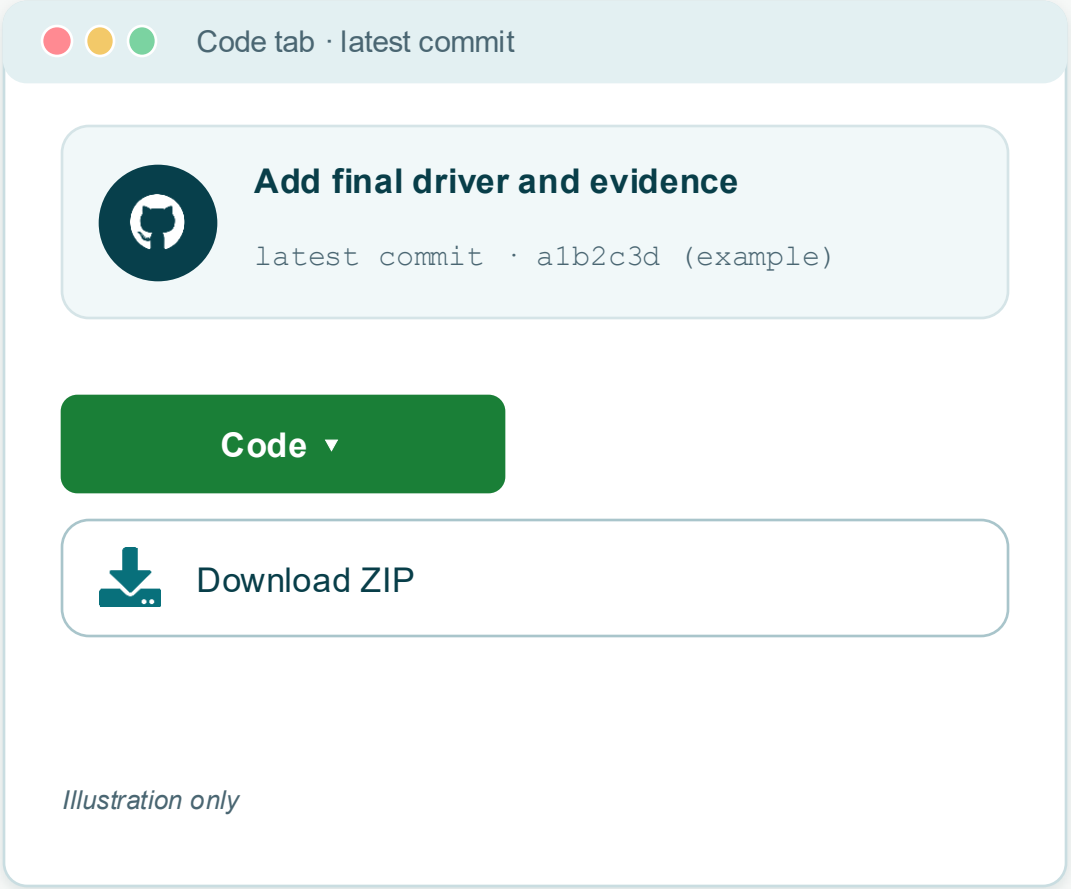

Test the video link separately

Copy the repository URL from the address bar

A signed-out 404 on a private repository is expected. Do not guess the evaluator's username.

GitHub 5: the final snapshot

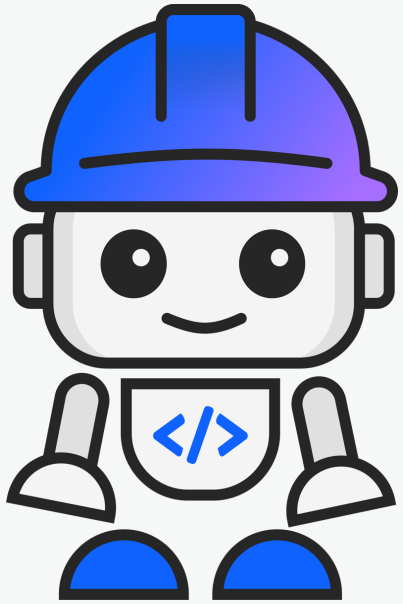

1. Check the committed files match your final copy
2. Copy the latest commit link for precise reference
3. Code > Download ZIP for a backup
4. Submit the repository link and tested video link

Submission content

Email to the organiser · template headings

- Name and actual team members
- Repository link and demonstration link
- Problem statement in 2–3 sentences
- Three genuine enhancements, if requested
- How IBM Bob helped and what you verified

Check the organiser's latest message for recipient, deadline and team policy.

A credible project explanation

Problem	The driver loses stability in corners
Change	Describe the actual implementation
Evidence	Give observed results and conditions
Bob	Explain its contribution and your review
Limitation	Name what still needs testing

Weak

“Bob optimised everything”

Strong

“Bob proposed a corner target adjustment; I checked the diff and compared two runs”

Final submission check

- No credentials, private data or unwanted kit files
- Every claimed result has matching evidence
- README names the exact script and environment
- Repository and video links open for evaluators
- Organiser requirements and learning plan checked

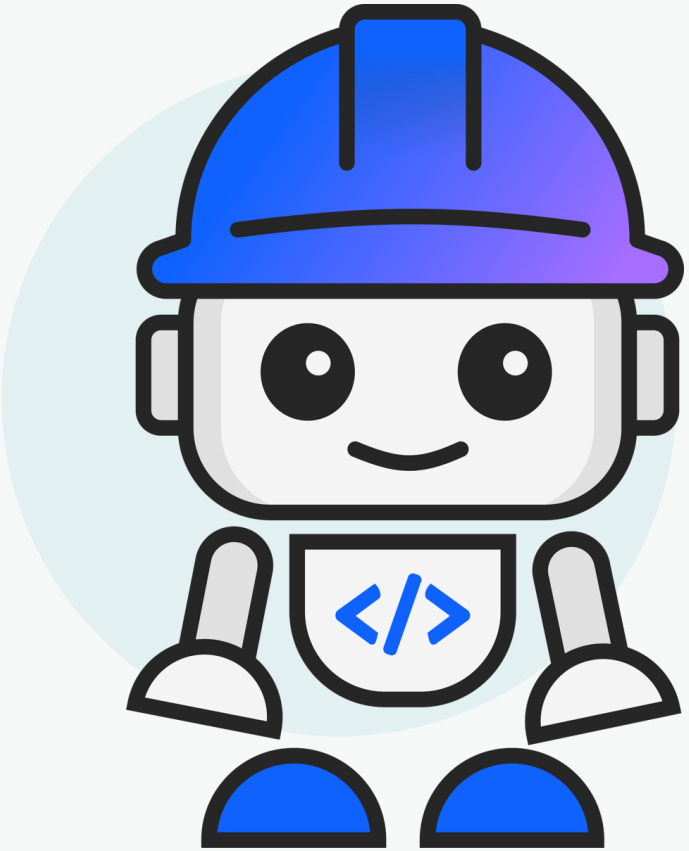

Three minutes: reply “ready” in chat, or name the exact missing item.

Showcase and reflection

Chat: exact file + observed result + one lesson

Add: repository ready / access pending / blocker

What did you accept, reject or change in Bob’s advice?

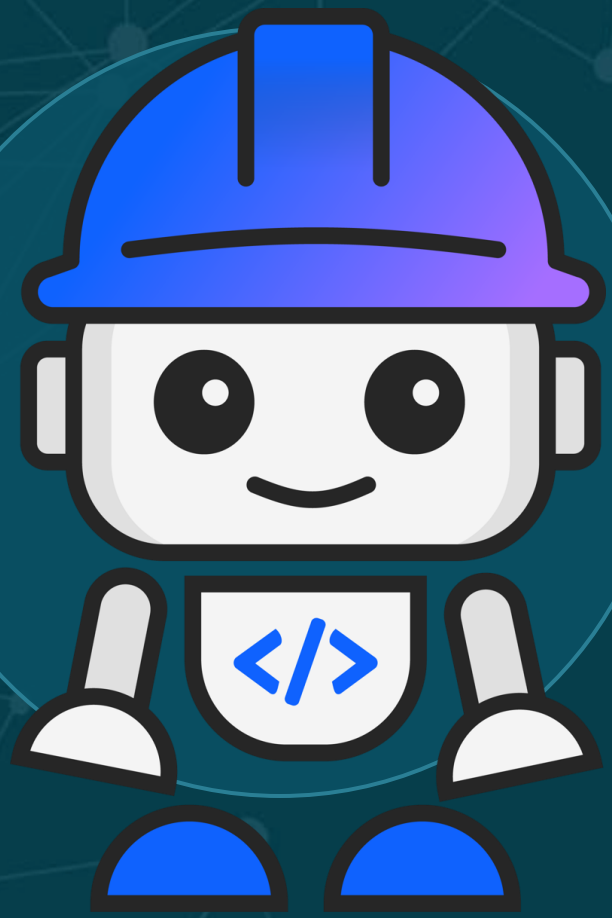

FINAL HANDOFF

Your final handoff

- A project you can explain
- Evidence you can trace
- Links the evaluator can open

Complete the organiser’s final checklist.
